Project README and Documentation

Pammela Vicenti Ribeiro
AI Engineer - Full-Stack for Generative AI Applications

Empório da Música AI Support Assistant

Public repository: https://github.com/pammelavicenti/emporio-musica-ai-agent

This document contains the complete README, data-quality notes, conversation review, and four real conversation transcripts, in that order. Markdown headings, lists, links, code blocks, and tables are formatted for reading.

> The documentation is reproduced in full. The conversations were originally executed in Brazilian Portuguese and are presented as complete English translations. These translations are not new model executions. Product names, identifiers, timestamps, and BRL values are retained; the original reviewed files remain unchanged in the repository. The verification e-mail is synthetic challenge data. No credentials or raw tool JSON are included.

Empório da Música AI Support Assistant

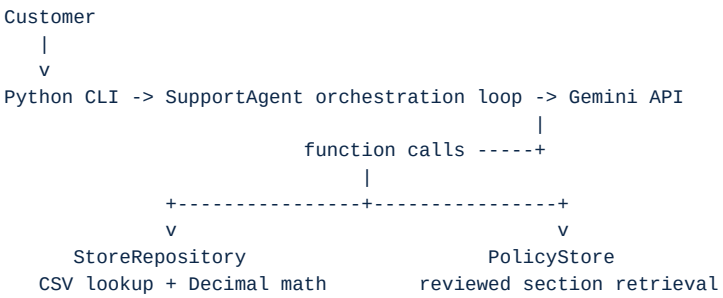

A Python prototype of a text-based customer support assistant for **Empório da Música**, a fictional musical instrument store in Campo Grande, Brazil. The assistant uses a real language model to conduct the conversation and typed Python tools to read the supplied catalog, promotions, orders, and store policies.

The implementation favors a small, inspectable architecture over an agent framework. It uses the Gemini API function-calling loop through Google's official Gen AI SDK, Python's standard CSV and `Decimal` libraries, and a lightweight keyword index for the eight-page policy manual.

What it does

- Searches instruments by text, category, availability, maximum current price, and an exact structured specification such as `electronics=yes` or `strings=nylon`.
- Exposes total/returned counts and `next_offset` so the model can consult remaining catalog pages before making a general conclusion.
- Reads list prices, stock, catalog status, and active promotions from the CSV files.
- Parses the JSON `specs` field and returns structured product specifications with an explicit parse status.
- Calculates PIX and promotional prices without floating-point errors or discount stacking.
- Assesses credit-card installments, rejects invalid counts explicitly, preserves the exact total after cent rounding, and reports any last-installment adjustment.
- Looks up orders only after matching the order ID and registered e-mail, then returns a privacy-limited view.
- Retrieves relevant policy sections for hours, address, payments, returns, delivery, warranty, privacy, and store scope.
- Asks for missing facts, distinguishes no result from a technical failure, and avoids claiming that it performed unsupported operations.
- Keeps conversational context during one CLI session.

Architecture

The LLM decides **which** read-only tool is needed and writes the natural-language answer. Python remains the source of truth for data access, authorization checks, and money calculations. Tool results are JSON and are returned to the model through the standard function-calling flow described in the official Gemini documentation.

Why this design

- **Function calling, not SQL generation:** the data is small and the permitted operations are narrow. Explicit functions are easier to validate and safer than model-generated queries.

- **No vector database:** the policy source is only eight pages and has strong section headings. A reviewed JSON extraction plus accent-insensitive keyword retrieval is transparent, fast, and reproducible.
- **No agent framework:** the Gemini function-calling loop is small and has no need for framework abstractions.
- **CLI interface:** the challenge explicitly accepts a CLI and evaluates agent behavior rather than front-end polish.
- `Decimal` **for BRL:** prices and percentage discounts must not use binary floats.
- **Stateless API requests:** conversation history is kept only in the local process and is resent with each GenerateContent request while the CLI is running.

Project structure

```
src/emporio_agent/
  agent.py          # Gemini API tool-calling loop
  cli.py            # terminal interface and dependency wiring

  prompt.py         # persona, grounding, privacy, and safety instructions
  repository.py     # CSV access and deterministic business rules
  tools.py          # strict tool schemas and safe dispatcher
data/
  *.csv             # supplied operational data
  políticas_da_loja.pdf
  policy_sections.json  # reviewed runtime extraction of the PDF
tests/              # standard-library unit and orchestration tests
examples/
  generated/        # ignored raw API output
  reviewed/         # source-checked real Gemini transcripts, versioned
docs/               # data notes, conversation review, and summary source
```

Requirements

- Python 3.11 or newer
- A Gemini API key
- An explicit `GEMINI_MODEL` confirmed for the same Google AI project; the corrected catalog run used `gemini-2.5-flash`, while scenarios 02-04 used `gemini-3.5-flash-lite`
- Internet access when running the assistant

The runtime code deliberately has **no implicit model default**: configuration must remain explicit. The supplied `.env.example` records the original `gemini-3.5-flash-lite` configuration; the catalog correction was executed with `gemini-2.5-flash` after the original model returned 503 high-demand errors. Availability must still be confirmed for the caller's key/project. The access-check script uses the key's model catalog and then forces a small Gemini function call before the model is considered validated. See the official model-list API.

Installation

From the repository root:

```
python -m venv .venv
.\.venv\Scripts\Activate.ps1
python -m pip install --upgrade pip
python -m pip install -e .
Copy-Item .env.example .env
```

Edit `.env` and set your own key:

```
GEMINI_API_KEY=your_key_here
GEMINI_MODEL=gemini-3.5-flash-lite
```

Create or copy a key in Google AI Studio. To list the models visible to the key/project, temporarily leave `GEMINI_MODEL` blank and run:

```
python scripts/check_model_access.py
```

Choose an appropriate text model from that project-specific output, set `GEMINI_MODEL`, and run the same command again. A successful result confirms both catalog visibility and an actual Gemini function call. Merely copying a model ID from public documentation is not treated as validation.

The `.env` file is ignored by Git. Do not place a key in source code, examples, logs, or screenshots.

On macOS or Linux, activate the environment with `source .venv/bin/activate` and copy the environment file with `cp .env.example .env`.

Run

```
python -m emporio_agent
```

or, after editable installation:

```
emporio-assistant
```

Type `sair` to end the session.

Tests

The test suite does not need an API key. It validates the deterministic tools and uses a fake Gemini client to exercise the orchestration loop without pretending that a real model was called.

```
python -m unittest discover -s tests -v
```

Current local result: **39 tests passed** on Python 3.13.1. Covered risks include:

- source loading and expected row counts;
- accent-insensitive product filtering and price sorting;
- remaining catalog pages, specification filters applied before pagination, valid page bounds, and consistent empty-page metadata;
- exact GN-15 source cents (`689.00`) and discovery of Shelby 107 (`799.00`, `electronics=yes`) beyond the first eight results;
- active, out-of-stock, coming-soon, and discontinued availability states;
- exact promotion and PIX calculations;
- non-cumulative discounts;
- structured parsing and error reporting for product specifications;
- explicit rejection of zero, negative, and excessive installment counts;
- exact reconciliation of the final price with rounded installment values;
- contradictory installment thresholds;
- privacy-preserving order verification;
- contact, payment-policy, CNPJ, tracking, promotion-calendar, response-time, and policy-governance retrieval;
- project-specific model-list and forced function-call validation with mocks;
- conversation continuity across user messages;
- sanitized unknown-tool and invalid-argument failures;
- Gemini's manual model -> tool -> model round trip, including a `user`-role function response and preservation of the function-call ID.

Interaction examples

examples/illustrative_conversations.md contains four **illustrative, not API-executed** conversations. They are based on real deterministic tool outputs and are included so the intended behavior can be reviewed without misrepresenting a model run.

After configuring a key and confirming the model, generate four real LLM transcripts with:

```
python scripts/generate_examples.py
```

The generator supports resuming a partial run and regenerating one scenario:

```
python scripts/generate_examples.py --resume
python scripts/generate_examples.py --scenario 01_catalog_continuity
```

The script first performs the project-specific model/function-calling check. It then writes one Markdown file per conversation and a `.tools.json` trace of actual tool calls/results to `examples/generated/`, records the configured model, and labels the files as real API executions. Raw generated output remains ignored by Git. Scenario 01 keeps the two original questions and adds a third explicitly about the whole matching catalog. Source-checked transcripts are preserved verbatim in examples/reviewed/; the prior rejected catalog output is retained in `examples/rejected/`. Supporting evidence and caveats are documented in docs/conversation_review.md.

Live Gemini result

- Provider/interface: Gemini API through `google-genai`.
- Models: `gemini-2.5-flash` for the corrected scenario 01; `gemini-3.5-flash-lite` for unchanged scenarios 02-04.
- Completed scenarios: catalog continuity and specifications, privacy-limited order lookup, multi-turn online-return policy, and out-of-scope handling.
- The previous approval of scenario 01 was revoked: its second answer changed the GN-15 price and incorrectly generalized from eight displayed products to the entire budget range. See the corrected review record in `docs/conversation_review.md`; passing deterministic tests alone does not approve model responses.
- The regenerated scenario 01 (2026-11-05, 17:52 America/Sao_Paulo) preserves GN-15 at R$ 689,00 across turns, limits the initial electronics statement to the eight shown products, and queries the whole matching catalog with `electronics=yes` to find Shelby 107 at R$ 799,00. Its tool trace and all nine returned records were checked against the CSVs; the reviewed response was copied byte-for-byte from generated output.
- Operational observation: other model probes encountered intermittent API-capacity errors, so the executed model is recorded explicitly rather than described as a universal default.

Source interpretation and known ambiguities

The original files were inspected before implementation. Detailed evidence is in docs/data_quality_notes.md. Important decisions are:

1. **Conflicting contacts:** page 2 lists `(67) 3341-4444`, while page 6 lists WhatsApp `(67) 3321-4500`. The cover and page 2 also disagree on whether the e-mail domain contains an accent. The agent reports the conflict and asks the customer to confirm with staff; it does not choose a definitive remote contact.
2. **Conflicting installment minimums:** the payment table says BRL 100.00 per credit installment. The detailed rules allow BRL 50.00 for up to 3 installments and BRL 80.00 for 4 to 6. Calculations below BRL 100.00 are therefore marked for manager confirmation instead of being approved automatically.
3. **Catalog state overrides physical stock:** a `coming_soon` item and a `discontinued` item both have positive stock. Only `status == active` and stock above zero is treated as available for sale.

4. **Returns need receipt facts:** orders have an order date and sometimes an estimated delivery date, but no actual receipt date or purchase channel. The agent asks for these facts and product condition instead of deciding eligibility from the order row.
5. **Historical totals are authoritative:** two stored order totals differ from today's list-price sum. The assistant reports the stored order total and does not recalculate a historical purchase using current prices.
6. **Promotion state comes from data:** campaign descriptions in the manual are not enough to claim a current discount. Only rows with `is_active == 1` are applied.

Privacy and security boundaries

- Order lookup requires order ID plus exact registered e-mail. A nonexistent order and a wrong e-mail return the same response to reduce order-ID enumeration.
- Successful order output excludes name, phone number, e-mail, city, and the full customer row.
- This is still **prototype verification, not authentication**. Production should use a signed-in account or one-time code, rate limiting, audit logs, and explicit consent.
- User text, CSV values, product descriptions, and retrieved policies are treated as untrusted data in the system prompt. Tools are read-only and cannot execute arbitrary code or mutate an order.
- Messages sent to the configured Gemini API may contain the verification e-mail typed by the user. A production privacy review should minimize or tokenize this value before sending model requests.

Limitations

- The completed live evaluation contains four curated scenarios; it is evidence of those executions, not a statistically comprehensive model-quality benchmark.
- Policy retrieval is lexical. It is appropriate for this short manual but may miss an unusual paraphrase.
- The CLI keeps history in memory only. It has no user accounts or persistence.
- It cannot place, reserve, cancel, exchange, return, or modify orders, and it does not register complaints.
- The CSV snapshot is not a real-time transactional system and concurrent stock changes are outside the prototype.
- Live Gemini calls depend on external capacity and quotas; deterministic tests remain the repeatable regression gate.
- Exact price copying and the scope of natural-language conclusions are instructed in the prompt; live output still requires source review. Tool tests do not guarantee that every model response follows those instructions.

What I would improve with more time

1. Expand the four reviewed live scenarios into a larger evaluation set with measured tool-call accuracy, groundedness, clarification behavior, and refusal quality.
2. Replace e-mail matching with authenticated customer sessions or one-time codes.
3. Move catalog and order access behind a production API with authorization, rate limiting, observability, and freshness guarantees.
4. Add policy-source citations to customer replies and a staff workflow for resolving contradictory source content.
5. Add structured telemetry that redacts personal data and tracks tool errors without logging message content by default.
6. Add a small web or messaging-channel adapter only after the core behavior is proven.

Use of AI coding assistants

OpenAI Codex was used as a development assistant to inspect the supplied files, propose the architecture, draft and revise code, create tests, and help write the documentation. Its outputs were not accepted blindly: source facts were checked against the original PDFs and CSVs, deterministic behavior was covered by tests, and ambiguous source rules were preserved instead of silently resolved. The candidate, **Pammela Vicenti Ribeiro**, is responsible for reviewing, understanding, running, and presenting the final work.

Submission note

Public repository: pammelavicenti/emporio-musica-ai-agent.

The short English delivery summary is in `docs/submission_summary.md`. The complete submission PDF is `Pammela Vicenti Ribeiro - AI Engineer - Full-Stack para Aplicações com IA Generativa.pdf`; its filename follows the requested delivery format. It contains this full README, `docs/data_quality_notes.md`, `docs/conversation_review.md`, and all four real reviewed conversations, in that order. The conversations are presented as complete, explicitly labeled English translations from `docs/translations/`; the original Portuguese transcripts remain unchanged. Credentials and raw tool JSON are excluded. The builder checks the original transcript hashes, turn counts, timestamps, identifiers, and BRL values against the translations.

To rebuild the PDF, install the optional document dependencies with `python -m pip install reportlab markdown-it-py`, then run `python scripts/build_submission_pdf.py`.

This local copy had no existing Git metadata, commits, or remotes when publication was prepared. Its Git history starts with the actual delivery preparation; no retroactive history was created. No e-mail or form submission has been sent. The repository must remain unchanged after the exact submission date and time, even if that timestamp is earlier than the process's final deadline. Future portfolio development belongs in a separate repository.

Data quality and source review

Review date: 2026-11-02
Reviewer: Pammela Vicenti Ribeiro

Sources inspected

- Technical challenge PDF: 3 pages.
- Store policy PDF: 8 pages, version 2.1, June 2025.
- Categories: 9 rows.
- Customers: 50 rows.
- Orders: 20 rows.
- Order items: 22 rows.
- Products: 65 rows.
- Promotions: 25 rows.

Primary and foreign-key references used by the prototype have no orphan rows.

Confirmed anomalies and decisions

Store contacts

- Policy cover: `(67) 3341-4444`, `contato@emporiodamusica.com.br`.
- Policy page 2: Telephone/WhatsApp `(67) 3341-4444`, with an accented domain in the displayed e-mail.
- Policy page 6: WhatsApp `(67) 3321-4500`.

Decision: retrieval returns the conflict. The assistant must not select one remote contact as definitive.

Credit-card minimum installments

- Page 3 summary table: up to 12 installments, minimum BRL 100.00.
- Page 3 detailed rules: up to 3 installments with a BRL 50.00 floor; 4-6 with an BRL 80.00 floor; 7-12 with a BRL 100.00 floor.

Decision: calculations on which both sections agree are returned as allowed or not allowed. Values between the detailed threshold and BRL 100.00 are returned as `needs_manager_confirmation`.

Catalog status and stock

- Product 96 is active with zero stock: unavailable because it is out of stock.
- Product 130 is `coming_soon` with two units: unavailable because it is not active.
- Product 136 is `discontinued` with 13 units: unavailable because it is discontinued.
- Product 113 is discontinued with zero stock.

Decision: sale availability requires both `status == active` and positive stock.

Orders and historical prices

- Order 3 total is BRL 3,450.00; the current list-price sum of its items is BRL 3,498.00.
- Order 20 total is BRL 1,400.00; the current list-price sum is BRL 1,488.00.

These differences may reflect historical pricing or discounts and are not treated as data corruption. Stored order totals remain authoritative for order-status answers.

Delivery and return eligibility

Delivered orders include an estimated delivery date but not an actual receipt timestamp. No purchase-channel field states whether the sale was online. Therefore, the seven-day withdrawal period cannot be evaluated from the order table alone.

Decision: ask for purchase channel, actual receipt date, product condition, packaging, and relevant exclusions before explaining possible eligibility.

Personal data

The customer CSV contains name, phone, e-mail, and city. It is synthetic challenge data but is treated as personal information. The order tool reads it only to verify an exact e-mail and does not return the customer row.

Policy extraction completeness review

The runtime policy extraction was checked again against all eight PDF pages. The review added material facts that were missing or incomplete: the CNPJ and company identity, mission and founding year, accepted debit-card brands, tracking-code format and example, named large-item freight cases, promotion calendar, five-minute service response target, standard service flow, and the instruction to consult management when a policy is uncertain. Customer-facing retrieval tests now cover these additions.

The extraction remains a reviewed operational representation rather than an automatic PDF parser. The original PDF stays in the repository as the authoritative source, and source contradictions are preserved instead of normalized away.

Real Conversation Review

Scope and controlling sources

The current Gemini API transcripts in `examples/reviewed/` preserve real model output without editorial rewriting. Scenario 01 was regenerated and checked directly against the product and promotion CSVs on 2026-11-05. Scenarios 02-04 retain their previous review against the supplied CSV snapshot, the eight-page store policy manual, and the reviewed `policy_sections.json` extraction; they were not rerun for this correction.

Review results

01 - Previous execution: approval revoked

The previous approval was incorrect and is withdrawn. The original output, executed at `2026-11-05T02:49:48.791736+00:00` with `gemini-3.5-flash-lite`, is preserved unchanged in `examples/rejected/01_catalog_continuity_previous.md` as rejected evidence, not an approved example.

- Its second answer quoted the Giannini GN-15 (84) at BRL 689.90, whereas the CSV price is BRL 689.00.
- It claimed there was no guitar with electronics in the whole budget range after seeing only eight of twelve matches. Shelby SGD-195E (107), BRL 799.00, has `electronics: yes` and was ninth in price order.
- Passing the previous 33 deterministic tests did not validate those natural-language claims. The former statements that every price matched and that the answer stayed within the eight shown products have been removed.

01 - Regenerated execution: source-checked

- Executed at `2026-11-05T20:52:24.705832+00:00` (17:52:24 in America/Sao_Paulo), with `gemini-2.5-flash`. The original configured model returned 503 high-demand errors on two attempts; the replacement was listed for the same account and passed the forced function-call probe. Calls were spaced to respect the replacement model's free-tier minute quota.
- The two original customer questions are unchanged. A third question explicitly asks about the entire catalog within the same budget and availability constraints.
- The first real tool call returns `count: 12`, eight products, and `next_offset: 8`. The answer says it shows eight of twelve and offers the remaining four. IDs in order: 83, 85, 89, 88, 81, 84, 87, 86.
- All eight displayed prices match the product CSV; none has an active promotion. The GN-15 is BRL 689.00 in both answers. The four shown nylon models are 83, 85, 81, and 84. All eight shown products have `electronics: no`; the second response explicitly limits its statement to those shown products.
- For the catalog-wide third question, the model performs a new search with `category: Violões`, `max_price_brl: 1000`, `only_available: true`, and `specification_key/value: electronics/yes`. That filter is applied before pagination, across the entire catalog. It returns one match: Shelby SGD-195E (107), BRL 799.00, active, six in stock, steel strings, `electronics: yes`. The description supports the pickup and integrated-tuner statements.
- The actual tool calls and results are retained in `examples/reviewed/01_catalog_continuity.tools.json`. All nine returned product records were independently checked against the product and promotion CSVs, including prices, specifications, stock, and status. The available under-budget catalog contains twelve products; 107 is the only one with electronics.
- The reviewed Markdown is byte-identical to the generated Markdown. No recorded assistant answer was edited manually. The live run exercises specification filtering; remaining-page retrieval is separately covered by deterministic tests.

Implementation and regression checks

Search now exposes bounded `limit`/`offset`, total and returned counts, `next_offset`, and exact specification key/value filtering. `truncated` means the current page omits some matching products, including an omitted prefix on later pages; `next_offset` determines whether more pages remain. The prompt requires exact preservation of monetary cents, distinguishes displayed-item questions from catalog-wide questions, and requires remaining-page consultation or a relevant specification filter before a general conclusion.

All 39 local tests pass on Python 3.13.1. Six added regression tests cover GN-15 source cents, Shelby beyond the first eight results, full-catalog specification filtering, page bounds, empty/exhausted pages, and tool-dispatch/schema support. These tests verify deterministic behavior; prompt compliance still requires live source review.

02 - Order lookup: approved with a snapshot caveat

- Order 8 is linked to one Kala KA-C Concert Mogno, has status `shipped`, tracking code `BRJL5544332BR`, and estimated delivery date 2026-02-28 in the CSVs.
- The tool requires the exact registered e-mail before returning the order. The assistant response does not repeat the e-mail or disclose the customer's name, phone, city, or internal customer record.
- The e-mail remains visible in the customer message because this is the original, synthetic challenge transcript. The reviewed directory must still be treated as containing personal-data-shaped test data.
- The delivery date is an estimate from a static snapshot, not evidence of actual delivery or current carrier status.

03 - Return-policy continuity: approved

- The first answer correctly asks for the purchase channel, actual receipt timing, and product/packaging condition instead of inferring eligibility from an order date.
- The second answer correctly applies the manual's online withdrawal rule: up to seven calendar days after receipt, no use, original packaging, accessories and manuals, with return shipping paid by the store.
- The assistant does not claim to execute or register the return and directs the customer to staff for the operational next step.

04 - Out-of-scope handling: approved

- The manual states that the store sells instruments only and excludes accessories, pedals, and amplifiers.
- The assistant declines the weather request, does not invent a forecast or partner store, and redirects to supported instrument shopping.

Cross-cutting assessment

- **Grounding:** All product, price, specification, order, and policy claims checked above are supported by the supplied sources.
- **Calculations:** No transcript states an independently calculated exact total or installment amount. Displayed catalog prices match deterministic tool output; the general PIX rule is applicable to the displayed non-promotional items.
- **Context:** The regenerated catalog scenario distinguishes the previously displayed eight products from a subsequent catalog-wide query. The unchanged return scenario retains the eligibility facts supplied in its second turn.
- **Privacy:** The order response is privacy-limited. The transcript includes the synthetic verification e-mail only because it was provided in the original customer prompt.

- **Policy application:** The return and scope answers follow the manual without claiming unsupported actions.
- **Known operational limit:** The CSVs are a static snapshot and the transcript is not evidence of live stock, carrier status, or fulfillment after the execution timestamp.

Approval

Only the regenerated scenario 01 receives the new source check described above. Scenarios 02-04 retain their prior review status and caveats. The earlier scenario 01 remains rejected and its former approval is revoked. This is evidence for these specific executions, not a general model-quality guarantee or a production data source/authentication system. This conversation review preceded publication; the current delivery status and confirmed repository address are recorded in the README. No e-mail or form submission has been sent.

Customer: Which acoustic guitars are available costing up to R$ 1.000?

Assistant: I found 12 acoustic guitars available for up to R$ 1.000! Here are the first 8:

- **Guitar Tagima Memphis AC-39 Nylon Natural** (ID: 83) - R$ 429,90
- **Guitar Rozini RC-104 Nylon Estudante** (ID: 85) - R$ 459,90
- **Guitar Shelby SN-100 Folk Aço Preto** (ID: 89) - R$ 549,00
- **Guitar Giannini GF-1R Aço Folk Sunburst** (ID: 88) - R$ 579,90
- **Guitar Yamaha C40 Nylon Natural** (ID: 81) - R$ 599,90
- **Guitar Giannini GN-15 Nylon Cedr Natural** (ID: 84) - R$ 689,00
- **Guitar Yamaha F310 Aço Natural** (ID: 87) - R$ 699,90
- **Guitar Tagima Dallas Tuner Aço Natural** (ID: 86) - R$ 749,00

Let me know if you would like to see the other 4 options!

Customer: Of these, which have nylon strings, and do any of them have electronics?

Assistant: Of the guitars I showed you, these have nylon strings:

- **Guitar Tagima Memphis AC-39 Nylon Natural** (ID: 83) - R$ 429,90
- **Guitar Rozini RC-104 Nylon Estudante** (ID: 85) - R$ 459,90
- **Guitar Yamaha C40 Nylon Natural** (ID: 81) - R$ 599,90
- **Guitar Giannini GN-15 Nylon Cedr Natural** (ID: 84) - R$ 689,00

None of these guitars has electronics.

Customer: And considering the entire catalog, is there any acoustic guitar available for up to R$ 1.000 with electronics?

Assistant: Yes, I found a guitar with electronics available for up to R$ 1.000:

- **Guitar Shelby SGD-195E Elétrico Aço Sunburst** (ID: 107) - R$ 799,00

It is a dreadnought electro-acoustic guitar with a pickup and built-in tuner, with steel strings.

Real LLM transcript - 03 return policy continuity

- Executed at: 2026-11-05T02:48:03.517158+00:00
- Model: `gemini-3.5-flash-lite`
- Interface: Gemini API with local function tools

Customer: I bought an instrument and changed my mind. Can I return it?

Assistant: Yes, it is possible in some cases! To find out whether a change-of-mind return applies to your situation, I need three pieces of information:

1. **Where did you buy it?** (Was it online or directly at the physical store?)
2. **When did you receive the product?**
3. **What is the condition of the instrument and its original packaging?** (Has it been used?)

Once you give me those details, I will explain how the process works here!

Customer: The purchase was online, I received it yesterday, and the instrument is unused in its packaging.

Assistant: Perfect! Since the purchase was online and you received the product yesterday (within the period of up to 7 calendar days), you have the right to withdraw from the purchase.

The instrument must be unused, in its original packaging, with all accessories and manuals. Since this virtual assistant cannot directly carry out or register the return request, the next step is to contact our store's customer service to request the refund and receive shipping instructions (we cover the return shipping).

Let me know if you need help with the store's contact details or opening hours!

Customer: Do you sell guitar pedals? And what is the weather forecast for tomorrow?

Assistant: Hello! How are you?

We only sell musical instruments, so effects pedals, accessories, and amplifiers are unfortunately not part of our catalog. As for the weather forecast, unfortunately I cannot help you with that here.

Can I help you find a musical instrument?
